What ideal inspires you-gives you passion-for the engineering profession?

I always imagined life simpler and easier, therefore, when I see a problem, I try to come up with different solutions in mind. The best inspiration in life for me, is the fact that when I become an engineer, I can really take my ideas and bring them to life. Either software, or hardware, as long as I resolve some problem in the world that effect people's life, it will make me happy. I have been helping people and working with direct customers for a while but when I look at my future, I would like to take my knowledge and skills and use them to effect bigger crowd of people's lives.

What ideals would inspire other engineers and get them interested in your own ideals as an engineer?

Engineering is a broad field which by thinking critically, you can make a huge impact in the world without even noticing. The best part of being an engineer is that you can have an entrepreneurial mind and start building something from scratch or you can work in a team where the foundation is already build and you help in developing and maintaining what already exist, however, you always have to look the bigger picture which is no matter how small is the portion of work you do in a group, it will become a part of a bigger project and have a bigger impact.

What is unique about the dream you or your peers have about being an engineer?

What distinguished my dreams is how I think about making money in this field. I don't think of engineers as people who make a lot of money, however, I think of it as if you set your mind on a bigger goal, and make more people's life better, you will start making more money as you grow in engineering. This thinking helps me to think less about how to make money, but rather think which idea is better to pursue, or which idea can have a better effect in long term.
